

To find the percentage of patients who had vomiting , we need to look at the " Pre val ence among episodes " column for the " V om iting " symptom . According to the table , the prevalence of vomiting is 32 .

This is the number of episodes of vomiting out of the total number of episodes . To find the percentage , we divide the prevalence by the total number of episodes ( which is the sum of all the prevalence values ) and multiply by 100 .

$$\begin{aligned} \text{Total number of episodes} &= 32 + 12 + 83 + \\ &+ 29 + 1 + 10 + 13 + 24 + \\ &+ 34 + 38 + 3 + 3 + 92 + \\ &+ 61 + 27 + 72 + 61 = 525 \end{aligned}$$

Percentage of patients who had vomiting =  $( 32 / 525 ) * 100 \approx 6 . 10 \%$  So , approximately 6 . 10 % of patients had vomiting .
